D6: SYSTEM DESIGN DOCUMENT

Deliverable ID	D6
Deliverable Title	System Design Document
Project	PSD3 Group Exercise 2
Team	L
Authors	Dan Tomosoiu
	Peeranat Fupongsiripan
	Hector Grebbell
	Michael Kilian
	Tony Lau
Deliverable Date	30 Jan 2013
File Name	SystemDesign.tex
Version	

1 Introduction

1.1 Identification

This document outlines the proposed design for the Internship Management System.
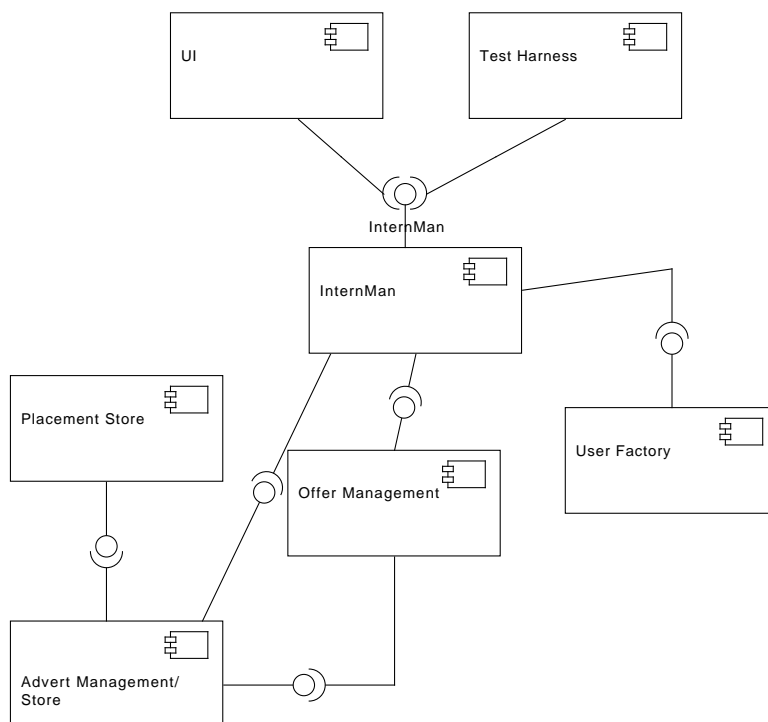

1.2 Related Documentation

- Requirements Specification Document (`http://fims.moodle.gla.ac.uk/file.php/128/coursework/requirements-specification-ge2.pdf`)

1.3 Document Status and Schedule

30/01/2013 - First Draft
27/02/2013 - Final Version

2 System Overview

The proposed system consists of the following components:

- InternMan: This component contains an implementation of the InternMan facade provided and can be seen as the 'main' component for the system.

- User Factory: Provides methods for creating new users of different types, storing created users and fetching users from this store. This component also providesservices for authenticating a user's login credentials using a stored username/password combination. Note that this contains the provided UserStore component (not shown).

- Offer Management: Handles offers made to students.

- Advert Management/Store: This component provides the necessary services to create and view adverts, associated these with an employer account, etc. It simultaneously manages the storage and retrieval of adverts from an appropriate source.

- Placement Store: Provides services for manipulating internships and associating these with an appropriate role.
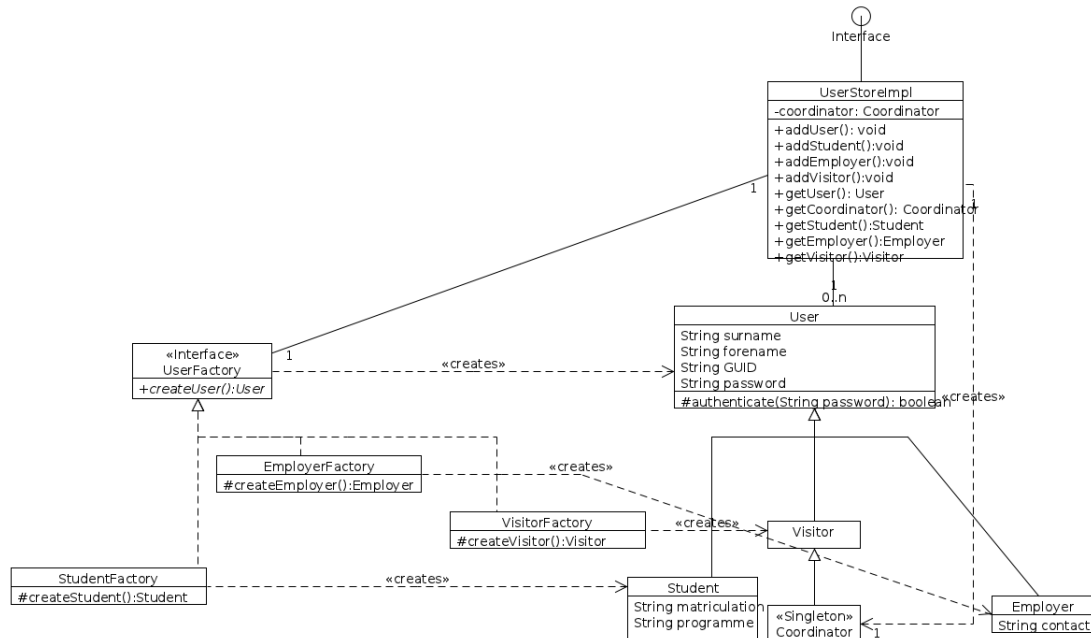

3   State Machine Diagram

3.1   Description and Rationale

The state machine diagram shows the state of objects within the Internship Management System at any given moment in time.
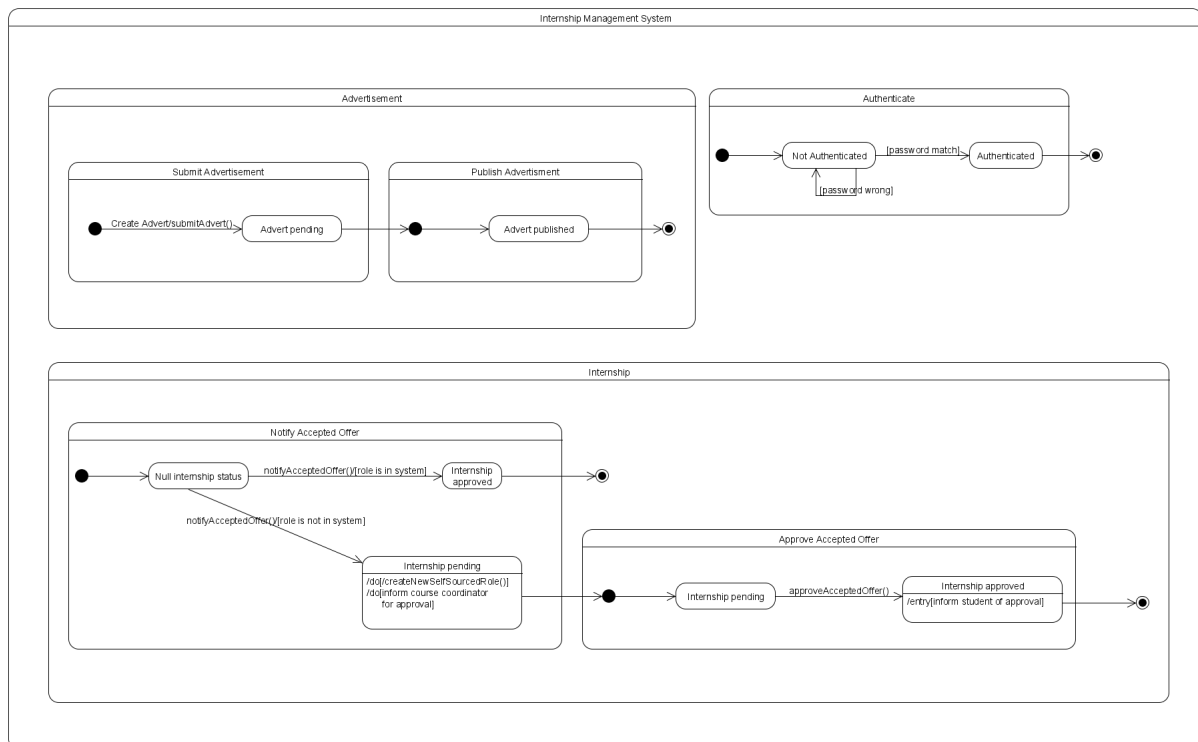

4 Component Breakdown

4.1 User Factory

4.1.1 Description and Rationale

There is a need to create many different categories of user in the system who share attributes and methods. For example all users must be able to log in using a method to authenticate an input password. In this situation it is appropriate to employ the factory design pattern for the creation of generic users, visitors, students and employers. The coordinator is not instantiated by a factory, but instead is implemented according to the singleton design pattern.

UserStoreImpl groups the methods of these factories and entities together to provide methods for creating and fetching each class of user. For the moment the exact means by which these users will be stored has not been decided, but this should also be handled by UserStoreImpl. The method set for UserStoreImpl is equivalent to the API for the UserFactory component.

4.1.2 API

UserStoreImpl implements UserStore
Methods
public void addUser(String surname, String forename, String GUID, String password)
Adds a new user to the store.
Parameters
String surname
String forename
String GUID
String password

public void addVisitor(String surname,String forename,String GUID, String password)
Adds a new visitor to the store
Parameters
String surname
String forename
String GUID
String password

public void addStudent(String surname,String forename,String GUID, String password,String matriculation,String programme)
Adds a new student to the store
Parameters
String surname
String forename
String GUID
String password
String matriculation
String programme

public void addEmployer(String name, String contact, String password)
Adds a new employer to the store
Parameters
String name
String contact
String password

public boolean addCoordinator(String surname, String forename, String GUID, String password)
If one does not exist, a new coordinator is added and true is returned. Else false is returned. **Parameters**
String surname
String forename
String GUID
String password

public User getUser(String GUID, String password)
Returns a user specified by the GUID, if authentication is successful.
Return the user specified by GUID, if the password is a match
Parameters
String GUID
String password

public Visitor getVisitor(String GUID, String password)
Returns a visitor specified by the GUID, if authentication is successful.
Return the visitor specified by GUID, if the password is a match
Parameters

String GUID
String password

public Student getStudent(String GUID, String password)
Returns a Student specified by the GUID, if authentication is successful.
Return the student specified by GUID, if the password is a match
Parameters
String GUID
String password

public Visitor getEmployer(String contact, String password)
Returns an employer specified by the contact if authentication is successful.
Return the employer specified by contact, if the password is a match
Parameters
String contact
String password

public Visitor getCoordinator()
Returns the coordinator instance.
Return the coordinator instance
Parameters
String contact
String password

public Map¡String,User¿ getUserMap()
Returns map holding all current users.
Return The user store's user map.
Parameters
N/A

public Map¡String,Visitor¿ getVisitorMap()
Returns map holding all current visitors.
Return The user store's visitor map.
Parameters
N/A

public Map¡String,Student¿ getStudentMap()
Returns map holding all current students.
Return The user store's student map.
**Parameters**
N/A

public Map¡String,Employer¿ getUserMap()
Returns map holding all current employer.
Return The user store's employer map.
Parameters

N/A

4.2 Offer Management

```
                    «Interface»
                  OfferManagement
 + notifyAcceptedOffer(Role role, String managerName, String managerEmail):
 + approveAcceptedOffer(String matriculation): void
 + createNewSelfSourcedRole(String title, String location, Date start, Date
 end, String description, Double salary): Role
```

4.2.1 Description and Rationale

This component is needed to allow students to notify the course coordinator that they have accepted an internship. If the internship was advertised in the internship management system, then it is automatically approved. Otherwise, the student can create a new self-sourced role which will send an email to the course coordinator asking for approval. Approval is done through this component.

4.2.2 API

OfferMangementImpl implements OfferManagement
Methods

public void notifyAcceptedOffer(Role role, String managerName, String managerEmail)
Sends email to coordinator informing that a student has accepted an internship
Parameters
Role role
String managerName
String managerEmail

public void approveAcceptedOffer(String matriculation)
Sends email to coordinator informing that a student has accepted an internship
Parameters
String matriculation

public Role createNewSelfSourcedRole(String title, String location, Data start, Date end, String description, Double salary)
Sends email to coordinator informing that a student has accepted an internship
Return
Returns the newly created self-sourced role
Parameters
String title
String location
Data start
Date end

String description
Double salary

4.3 Advert Management/Store

```
                    AdvertManagement
LinkedList«Advert» adverts
int numAds
+ getAd(long id): Advert
+ getPublishedAds(): LinkedList«Advert»
+ getAllAds(): LinkedList«Advert»
+ publishAd(long id): void
+ addAd(Advert ad): boolean
+ delAd(long id): boolean
+ addPlacement(Placement p): boolean
+ viewPlacement(int id): Placement
+ delPlacement(int id): boolean
+ editPlacement(int id, Placement p): boolean
+ editAd(int id, Advert a): boolean
```

4.3.1 Description and Rationale

Advert Management/Store is needed to handle creation, selection and publishing of all advertisements within the system. It interacts with other components which need information on adverts through the selectAdvertisement method which provides a handle on an advert with a supplied index.

4.3.2 API

public Advertisement getAd (long id)
Retrives advert indexed by id.
Return
Advertisement advert
Parameters
long id

public LinkedList¡Advertisement¿ getPublishedAds()
Retrives list of all published adverts
Return
LinkedList¡Advertisement¿ adverts.
Parameters
N/A

public LinkedList¡Advertisement¿ getAllAds()
Retrives list of all adverts
Return
LinkedList¡Advertisement¿ adverts.

7

Parameters
N/A

public void publishAd (long id)
Publishes advert indexed by id.
Return
void
Parameters
long id

public boolean addAd (Advertisement ad)
Adds new advert to store
Return
true if added successfully, false otherwise.
Parameters
Advertisement ad

public boolean delAd (long id)
Deletes advert indexed by id.
Return
True if advert found and deleted, false otherwise.
Parameters
long id

public boolean editAd (int id,Advert a)
Edit advert indexed by id to match a
Return
true if found and edited successfully, false otherwise.
Parameters
int id
Placement p

public boolean addPlacement (Placement p)
Adds new placement to the store.
Return
true if added successfully, false otherwise.
Parameters
Placement p

public Placement viewPlacement (int id)
Return placement identified by id

Return
Placement indexed by id if it exists, null otherwise.
Parameters
int id

public boolean editPlacement (int id,Placement p)
Edit placement identified by id to match p
Return
true if found and edited, false otherwise
Parameters
int id
Placement p

4.4   Placement Store

4.4.1   Description and Rationale

Placement Store contains all information on placements in the system at any given time and is needed
to allow other components to keep track of which placements are in the system and their status.

4.4.2   API

Interface PlacementStoreInf

Methods
public void viewPlacements()
Prints out all existing placements.

public Placement addPlacement(Placement p)
Add new placement.
Return: Placement p added if successful, otherwise null.
Parameters
Placement p

public Placement removePlacement(int id)
Return: Placement with identification number id removed if successful , otherwise null.
Parameters
int id

public Placement editPlacement(Placement p)
Edits existing placement.
Return: Placement edited if successful, null otherwise.
Parameters
Placement p

Class Placement
Contains details about the internship including the student taking and role involved.

public Placement(Role role, Student student, String manager , String contact, Status status)
Parameters
Role role
Student student
String manager
String contact
Status status

public Role getRole()
Return: Role of placement if exists, null otherwise.

public Student getStudent()
Return: Student secured the placement , null otherwise.

public String getManager()
Return: Manager if exists, null otherwise.

public String getContact()
Return: Contact details, if exists, null otherwise.

public Status getStatus()
Return: returns the status of a particular placement (value can be either APPROVED OR RE-JECTED)

setRole(Role r)
Return:
Parameters

Role r

setStudent(Student s)
Return:
Parameters
Student s

setManager(String m)
Return:
Parameters
String m
setContact(String c)
Return: Parameters String c

setStatus(Status s)
Return:
Parameters
Status s
